Seaborn implot with equation and R2 text

In my regular data analysis work, I have switched to use 100% python since the seaborn package becomes available. Big thanks to this wonderful package. However, One excel-chart feature I miss is to display the polyfit equation and/or R2 value when use the Implot() function. Does anyone know an easy way to add that?

possible duplicate of [How do I calculate r-squared using Python and Numpy?](#) – [MattDMo](#) Aug 30 '14 at 5:36

It's not really a duplicate because the question is whether this can be added automatically by the seaborn functions, not how to calculate it manually. – [mwaskom](#) Aug 30 '14 at 15:16

1 Answer

It can't be done automatically with `Implot` because it's undefined what that value should correspond to when there are multiple regression fits (i.e. using a `hue`, `row` or `col` variable).

But this is part of the similar `jointplot` function. By default it shows the correlation coefficient and p value:

```
import seaborn as sns
import numpy as np

x, y = np.random.randn(2, 40)
sns.jointplot(x, y, kind="reg")
```

But you can pass any function. If you want R^2 , you could do:

```
from scipy import stats
def r2(x, y):
    return stats.pearsonr(x, y)[0] ** 2
sns.jointplot(x, y, kind="reg", stat_func=r2)
```

Thanks, I think I can use the `jointplot()` one by one instead of the nice multiple chart feature of `Implot()`. However, can the top/side histograms be optional so that I can pack many into a `Implot()` equivalent. – [user3287545](#) Aug 30 '14 at 16:09

What is p value (0,22) here? I guess pearson correlation is `pearsonr` value. – [cacert](#) Jan 6 at 20:41
