- ❖ Portfolio optimisation is computationally expensive: **Kuhn–Tucker conditions**.
- ❖ The distribution of stock relatives must be known!
- ❖ The assumption of stationary, independent markets is too simplistic: **universal portfolios**.

# Disclaimers

---

- ❖ Portfolio optimisation is computationally expensive: **Kuhn–Tucker conditions**.
- ❖ The distribution of stock relatives must be known!
- ❖ The assumption of stationary, independent markets is too simplistic: **universal portfolios**.
- ❖ The analysis ignores **transaction costs**.  
These will quickly wipe out any gains from constant portfolio rebalancing.
