

The background of the slide is a complex network graph with numerous nodes and edges, rendered in a reddish-brown color. Overlaid on this are several semi-transparent rectangular panels. The top-left panel shows a grid of small, light-colored plus signs. The bottom-left panel displays a scatter plot with orange and blue dots, some of which are larger than others. The right side of the slide features a vertical strip of white lines on a dark background. The main title is centered in a large, bold, black font.

# **Session 3. Pattern Discovery for Software Bug Mining**

# Pattern Discovery for Software Bug Mining

---

- ❑ Software is complex, and its runtime data is larger and more complex!
- ❑ Finding bugs is challenging: Often no clear specifications or properties; need substantial human efforts in analyzing data
- ❑ Software reliability analysis
  - ❑ Static bug detection: Check the code
  - ❑ Dynamic bug detection or testing: Run the code
  - ❑ Debugging: Given symptoms or failures, pinpoint the bug locations in the code
- ❑ Why pattern mining?—Code or running sequences contain hidden patterns
  - ❑ Common patterns → likely specification or property
  - ❑ Violations (anomalies comparing to patterns) → likely bugs
  - ❑ Mining patterns to narrow down the scope of inspection
    - ❑ Code locations or predicates that happen more in failing runs but less in passing runs are suspicious bug locations

# Typical Software Bug Detection Methods

---

## ❑ Mining rules from source code

- ❑ Bugs as deviant behavior (e.g., by statistical analysis)
- ❑ Mining programming rules (e.g., by frequent itemset mining)
- ❑ Mining function precedence protocols (e.g., by frequent subsequence mining)
- ❑ Revealing neglected conditions (e.g., by frequent itemset/subgraph mining)

## ❑ Mining rules from revision histories

- ❑ By frequent itemset mining

## ❑ Mining copy-paste patterns from source code

- ❑ Find copy-paste bugs (e.g., CP-Miner [Li et al., OSDI'04]) (to be discussed here)
  - ❑ **Reference:** Z. Li, S. Lu, S. Myagmar, Y. Zhou, “CP-Miner: A Tool for Finding Copy-paste and Related Bugs in Operating System Code”, OSDI'04

# Mining Copy-and-Paste Bugs

- ❑ Copy-pasting is common
  - ❑ 12% in Linux file system
  - ❑ 19% in X Window system
- ❑ Copy-pasted code is error-prone
- ❑ Mine “*forget-to-change*” bugs by sequential pattern mining
  - ❑ Build a sequence database from source code
  - ❑ Mining sequential patterns
  - ❑ Finding mismatched identifier names & bugs

```
void __init prom_meminit(void)
{
    .....
    for (i=0; i<n; i++) {
        total[i].adr = list[i].adr;
        total[i].bytes = list[i].size;
        total[i].more = &total[i+1];
    }
    .....
}
```

```
for (i=0; i<n; i++) {
    taken[i].adr = list[i].adr;
    taken[i].bytes = list[i].size;
    taken[i].more = &total[i+1];
}
```

Code copy-and-pasted but **forget to change “id”!**

(Simplified example from *linux-2.6.6/arch/sparc/prom/memory.c*)

# Building Sequence Database from Source Code

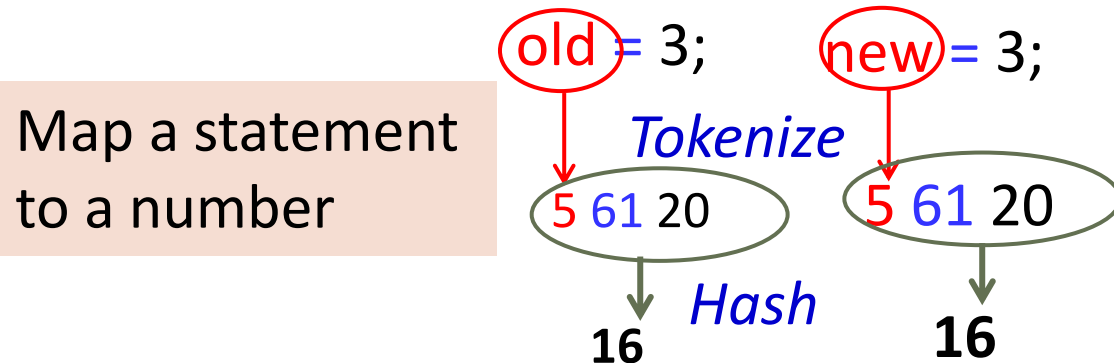

- Statement <sup>(mapped to)</sup> → number
- Tokenize each component
  - Different operators, constants, key words → different tokens
  - Same type of identifiers → same token
- Program → A long sequence
  - Cut the long sequence by blocks

Hash values

65	for (i=0; i<n; i++) {
16	total[i].adr = list[i].addr;
16	total[i].bytes = list[i].size;
71	total[i].more = &total[i+1];
	}
...	.....
65	for (i=0; i<n; i++) {
16	taken[i].adr = list[i].addr;
16	taken[i].bytes = list[i].size;
71	taken[i].more = &total[i+1];
	}

Final sequence DB:

(65)  
(16, 16, 71)  
...  
(65)  
(16, 16, 71)

# Sequential Pattern Mining & Detecting “Forget-to-Change” Bugs

- Modification to the *sequence pattern mining algorithm*

- Constrain the max gap

(16, 16, 71)

.....

(16, 16, 10, 71)

Allow a maximal gap:  
inserting statements  
in copy-and-paste

- Composing Larger Copy-Pasted Segments

- Combine the neighboring copy-pasted segments repeatedly

- Find conflicts: Identify names that cannot be mapped to the corresponding ones

- E.g., 1 out of 4 “**total**” is unchanged, *unchanged ratio* = 0.25

- If  $0 < \text{unchanged ratio} < \text{threshold}$ , then report it as a bug

- CP-Miner reported many C-P bugs in Linux, Apache, ... out of millions of LOC (lines of code)
