

# Install TensorFlow with pip

TensorFlow 2 packages are available

- `tensorflow` —Latest stable release with CPU and GPU support (<https://www.tensorflow.org/install/gpu>) (*Ubuntu and Windows*)
- `tf-nightly` —Preview build (*unstable*) . Ubuntu and Windows include GPU support (<https://www.tensorflow.org/install/gpu>) .

## Older versions of TensorFlow

For TensorFlow 1.x, CPU and GPU packages are separate:

- `tensorflow==1.15` —Release for CPU-only
- `tensorflow-gpu==1.15` —Release with GPU support (<https://www.tensorflow.org/install/gpu>) (*Ubuntu and Windows*)

## System requirements

- Python 3.6–3.8
  - Python 3.8 support requires TensorFlow 2.2 or later.
- pip 19.0 or later (requires `manylinux2010` support)
- Ubuntu 16.04 or later (64-bit)
- macOS 10.12.6 (Sierra) or later (64-bit) (*no GPU support*)
  - macOS requires pip 20.3 or later
- Windows 7 or later (64-bit)
  - Microsoft Visual C++ Redistributable for Visual Studio 2015, 2017 and 2019 (<https://support.microsoft.com/help/2977003/the-latest-supported-visual-c-downloads>)
- Raspbian 9.0 or later
- GPU support (<https://www.tensorflow.org/install/gpu>) requires a CUDA®-enabled card (*Ubuntu and Windows*)

Installing TensorFlow 2 *requires* a newer version of **pip** .

## Hardware requirements

- Starting with TensorFlow 1.6, binaries use [AVX instructions](https://en.wikipedia.org/wiki/Advanced_Vector_Extensions#CPUs_with_AVX) (https://en.wikipedia.org/wiki/Advanced\_Vector\_Extensions#CPUs\_with\_AVX) which may not run on older CPUs.
- Read the [GPU support guide](https://www.tensorflow.org/install/gpu) (https://www.tensorflow.org/install/gpu) to set up a CUDA®-enabled GPU card on Ubuntu or Windows.

# 1. Install the Python development environment on your system

Check if your Python environment is already configured:

es Python 3.6–3.8, pip and venv >= 19.0

```
$ python3 --version
$ pip3 --version
```

If these packages are already installed, skip to the next step.

Otherwise, install [Python](https://www.python.org/) (https://www.python.org/), the [pip package manager](https://pip.pypa.io/en/stable/installing/) (https://pip.pypa.io/en/stable/installing/), and [venv](https://docs.python.org/3/library/venv.html) (https://docs.python.org/3/library/venv.html) :

[Ubuntu](#) (#ubuntu) [macOS](#) (#macos) [Windows](#) (#windows) [Raspberry Pi](#) (#rasberry-pi) [Other](#) (#other)

```
$ sudo apt update
$ sudo apt install python3-dev python3-pip python3-venv
```

n: Upgrading the *system pip* can cause [problems](https://github.com/pypa/pip/issues/5599) (https://github.com/pypa/pip/issues/5599) .

n a virtual environment, use `python3 -m pip` for the commands below. This ensures that you upgrade and use the *Python pip* in the virtual environment instead of the *system pip* .

## 2. Create a virtual environment (recommended)

Python virtual environments are used to isolate package installation from the system.

[Ubuntu / macOS](#) (#ubuntu-macos) [Windows](#) (#windows) [Conda](#) (#conda)

Create a new virtual environment by choosing a Python interpreter and making a `./venv` directory to hold it:

```
$ python3 -m venv --system-site-packages ./venv 
```

Activate the virtual environment using a shell-specific command:

```
$ source ./venv/bin/activate # sh, bash, or zsh
```

```
$ . ./venv/bin/activate.fish # fish
```

```
$ source ./venv/bin/activate.csh # csh or tcsh
```

When the virtual environment is active, your shell prompt is prefixed with (venv) .

Install packages within a virtual environment without affecting the host system setup. Start by upgrading pip :

```
(venv) $ pip install --upgrade pip
```

```
(venv) $ pip list # show packages installed within the virtual environment
```

And to exit the virtual environment later:

```
(venv) $ deactivate # don't exit until you're done using TensorFlow
```

### 3. Install the TensorFlow pip package

Choose one of the following TensorFlow packages to install from PyPI (<https://pypi.org/project/tensorflow/>) :

- **tensorflow** —Latest stable release with CPU and GPU support (<https://www.tensorflow.org/install/gpu>) (*Ubuntu and Windows*) .
- **tf-nightly** —Preview build (*unstable*) . Ubuntu and Windows include GPU support (<https://www.tensorflow.org/install/gpu>) .
- **tensorflow==1.15** —The final version of TensorFlow 1.x.

ge dependencies are automatically installed. These are listed in the setup.py

s://github.com/tensorflow/tensorflow/blob/master/tensorflow/tools/pip\_package/setup.py) file under **REQUIRED\_PACKAGES** .

Virtual environment installSystem install (#system-insta...  
(#virtual-environment-install)

```
(venv) $ pip install --upgrade tensorflow
```

Verify the install:

```
(venv) $ python -c "import tensorflow as tf;print(tf.reduce_sum(tf.random.normal([1000,
```

ss: If a tensor is returned, you've installed TensorFlow successfully. Read the [tutorials](https://www.tensorflow.org/tutorials) (<https://www.tensorflow.org/tutorials>) to get started.

## Package location

A few installation mechanisms require the URL of the TensorFlow Python package. The value you specify depends on your Python version.

Version	URL
Linux	
Python 3.6 GPU support	<a href="https://storage.googleapis.com/tensorflow/linux/gpu/tensorflow_gpu-2.4.0-cp36-cp36m-manylinux2010_x86_64.whl">https://storage.googleapis.com/tensorflow/linux/gpu/tensorflow_gpu-2.4.0-cp36-cp36m-manylinux2010_x86_64.whl</a>
