KR **can anyone please explain the meaning and what should be output for the definition, i'm stuck in this**

krishnakant Reddy Week 5 · 4 months ago

Define a function that takes a Tensor batch of German data (as extracted from the training Dataset), and returns a tuple containing German inputs and outputs for the decoder model

especially the return statement

This function takes a batch of German dataset from the train dataset. for example, you could use this code to test the function you write:

for x, y in batch_train_data.take(1):

  print(x.shape)

  print(y.shape)

  res = gem_decoder_data(y)

  print(res[0].shape)

```
print(res[1].shape)
```

You could write a function like gem_decoder_data, for example, you input some German words like start I go to school. end it returns

start I go to school

I go to school end

You could see it from the picture in the assignment
